

Refrex® zone dividers are specially designed to separate your furnace into different zones. Because of the separation in zones, our zone dividers will force the heat to pass the products more frequently.

Refrex® zone dividers are temperature resistant (up to 1350°C) and are made out of Refrex® cloth, with on the inside a specially designed insulation blanket, supported with silicon carbide suspension profiles and ceramic fixing devices.

Refrex® zone dividers are designed to resist high temperatures at all sides. Due to the low thermal conductivity of the inside insulation and the high reflection value of the Refrex® material, **Refrex® zone dividers** do not accumulate heat and saves energy.

Due to the light weight construction of the Refrex® Zone Dividers they can easily be suspend from the roof with small silicon carbide profiles (different shapes & dimensions) and fixed onto the profiles with different kind of fixing pins / washers made out of high alumina ceramic.

Advantages Refrex® zone dividers:

- Are light weight and flexible
- Create several temperature sections without thermal shock of the material
- Are easy to install and de-install without damaging the zone divider
